14. Updating and uninstalling
15. Problems and what to do

How a Set moves through the team

Each Set of Bible passages goes through the same stages. Only one person holds a Set at a time. When they finish, they send it on to the next person.

Draft → Peer Check → Community Setup → Community Test → Community Review → Back Translation → Consultant Check → Approved

A reviewer can **send a Set back** when something needs to change. It then returns to the Drafter (or, from the Consultant, to the Back Translator) with comments that explain what to fix.

Role	Tiles you work on
Drafter	Sent back, Draft, Community Setup, Community Test, Feedback, Approved
Peer Checker	Peer Check, Community Review
Back Translator	Back Translation
Consultant	Consultant Check (approve or send back)

1. Before you start

You need

- An **Android phone or tablet** with Android 7.0 or newer. About **60 MB** free for the app itself, plus room for the audio of the Sets you are working on (a few hundred MB is typical).
- A quiet place to record. The phone's own microphone is fine; a headset microphone gives cleaner takes. Headphones help when you check recordings.
- An **internet connection** (Wi-Fi or mobile data) the first time you sign in, and whenever you send your work. You can record and review without internet in between.
- Your **email address and password**. Your project administrator gives you these. They are the same ones you use on the OraLogos website.
- The app file **OraLogos-0.1.0.apk**, downloaded from the OraLogos website. Your project administrator gives you the link.

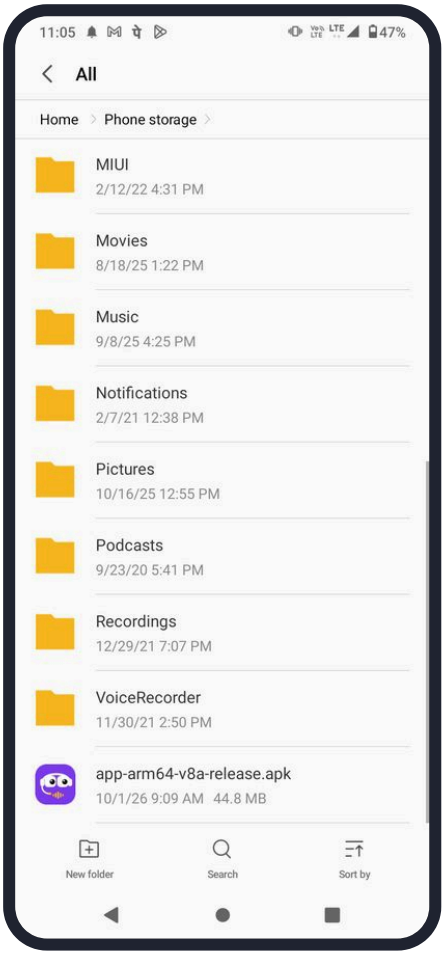

> You do not need to install anything else. Everything the app needs comes inside the APK file.

> Download the APK from the OraLogos website only. Do not install an OraLogos file that arrived from anywhere else.

2. Installing OraLogos on your phone

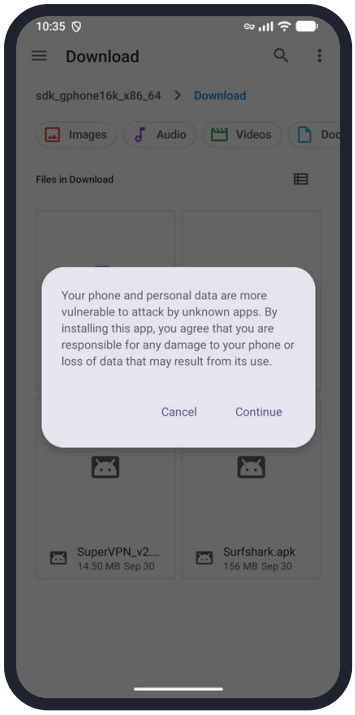

An APK is an app that is installed by hand from a downloaded file. Android checks with you several times before it lets such an app in. Every box below is normal. Answer them as shown.

1. **Download the APK on the phone.** Open the OraLogos website in the phone's browser and tap the download link: the file is saved into the phone's **Download** folder.
2. **Open the Files app** (on some phones it is called **My Files** or **File Manager**) and find the file — usually under **Download**, or in **Phone storage** if you copied it there. Tap the OraLogos APK.

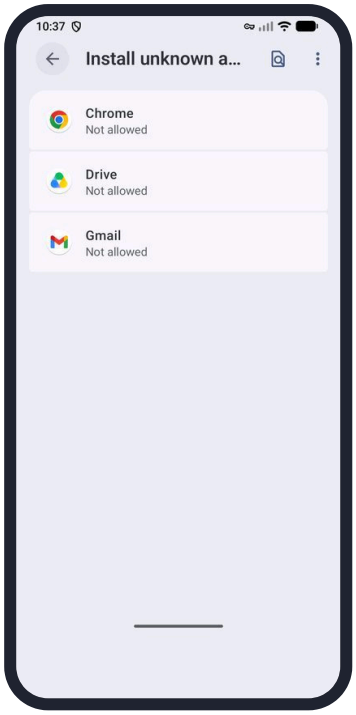

The Files app on a phone. Tap the OraLogos APK.

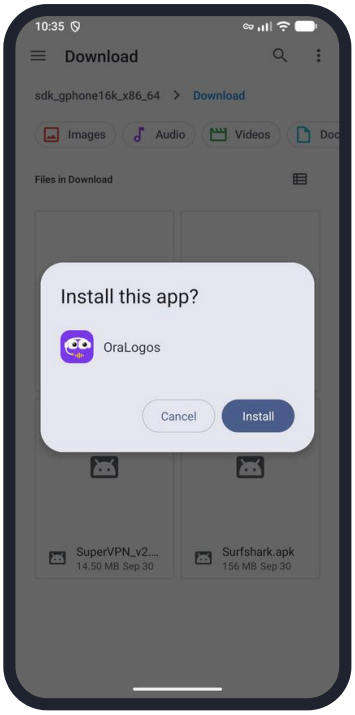

3. Android may say **"Your phone and personal data are more vulnerable to attack by unknown apps..."**. Tap Continue.
4. If instead it says the Files app is **not allowed to install unknown apps**, tap **Settings** on that box, switch on **Allow from this source**, then go back. You can also find this later under **Settings → Apps → Special app access → Install unknown apps**.
5. The box **Install this app?** shows the OraLogos icon. Tap Install.

The unknown-apps warning. Tap Continue.

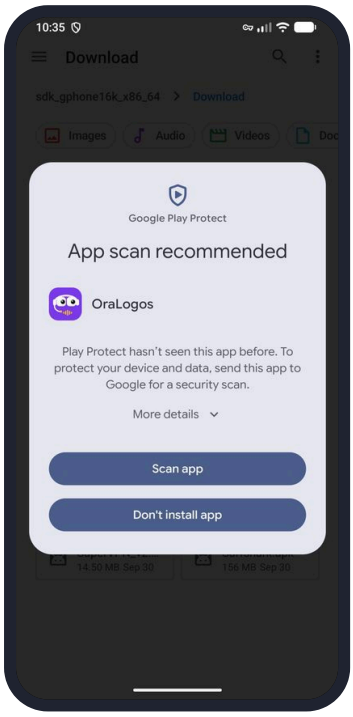

If the Files app is "Not allowed", allow it here.

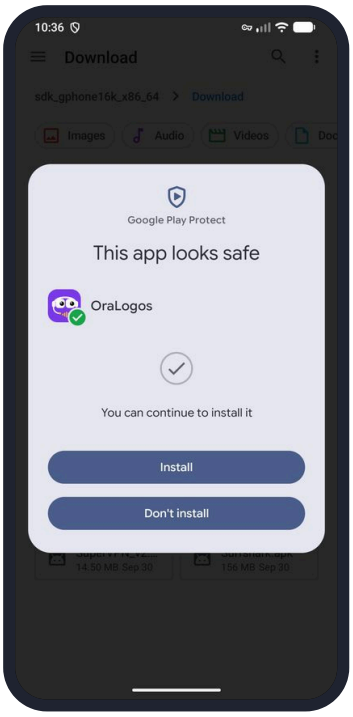

Install this app? Tap Install.

2. Installing OraLogos on your phone (continued)

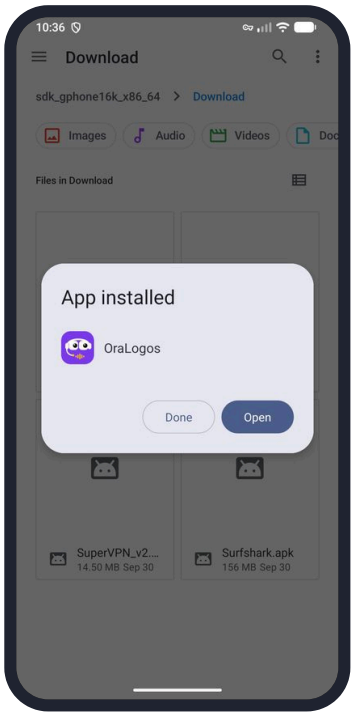

6. Android installs the app, then **Google Play Protect** may show **“App scan recommended”**: Play Protect has not seen this app before. Tap Scan app. The scan takes a few seconds and needs internet.
7. Play Protect answers **“This app looks safe”**. Tap Install.
8. **App installed.** Tap Open to start OraLogos now. Later, open it from the OraLogos icon in your app list.

Play Protect: tap Scan app.

This app looks safe: tap Install.

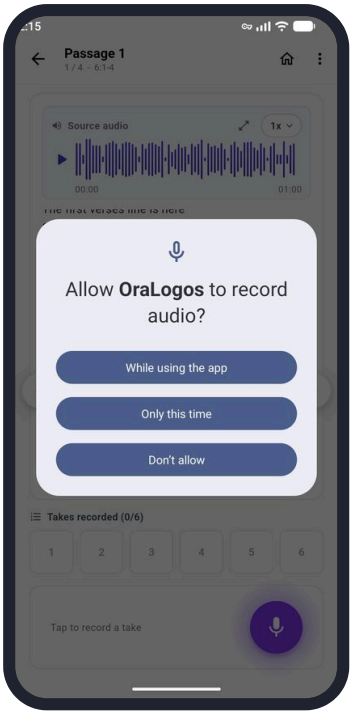

App installed: tap Open.

> Older phones show **“Blocked by Play Protect”** instead. Tap **More details** and then **Install anyway**. If there is no such option, open the phone’s **Play Protect** settings, switch **Scan apps with Play Protect** off, install OraLogos, then switch it on again.

Let the app use your microphone

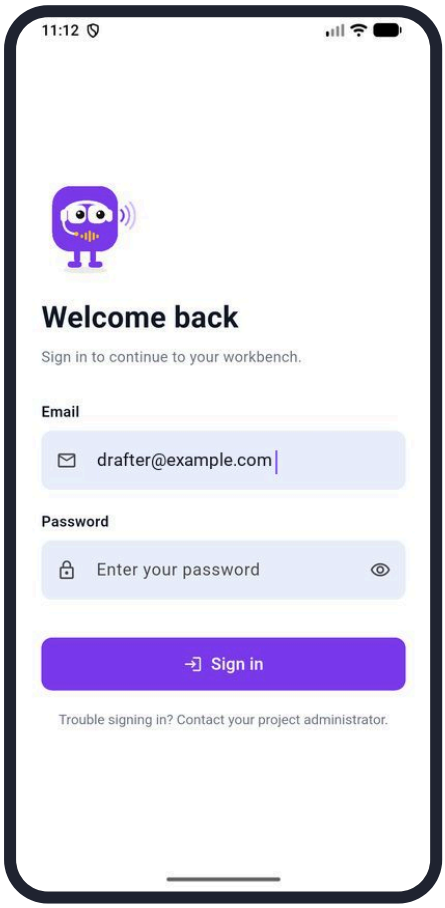

The first time you record, Android asks **“Allow OraLogos to record audio?”**. Tap **While using the app**. If you tapped **Don’t allow** by mistake, the record button says *Microphone is off*: tap **Open settings**, choose **Permissions → Microphone → Allow only while using the app**, and come back.

The first recording asks for the microphone. Tap While using the app.

3. Signing in

1. Type your **email** and **password**. Tap the eye icon to check what you typed.
2. Tap Sign in .
3. The app now **collects your data**: the source audio, the scripts, recordings, questions and comments for your Sets. The bar counts the files. The first download can take a few minutes on a slow connection. Keep the app open until it reaches 100%.

The sign-in screen.

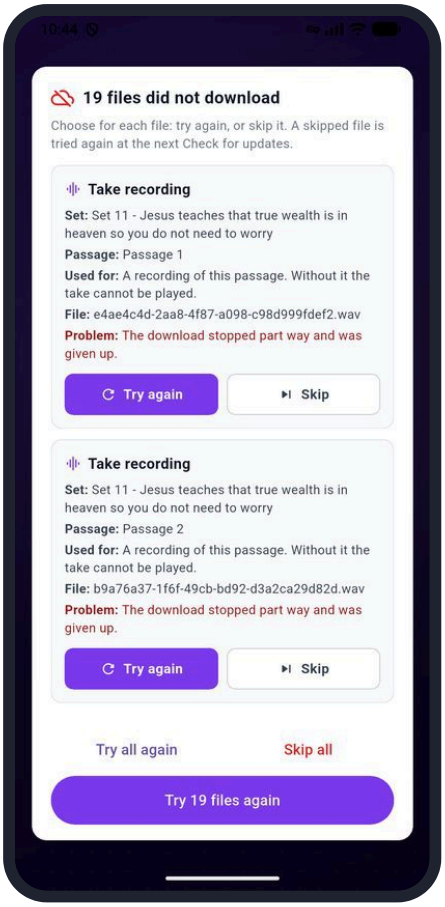

Collecting your data. Wait until it finishes.

If some files did not download

A weak connection can stop a few files. The app then lists every file it could not get: which Set and passage it belongs to, what it is used for, and what went wrong. For each one choose Try again (fetch it once more) or Skip (go on without it). Try all again and the big button at the bottom do all files at once.

A skipped file is fetched again at the next **Check for updates**, so nothing is lost — but a passage whose source audio is missing cannot be recorded until then.

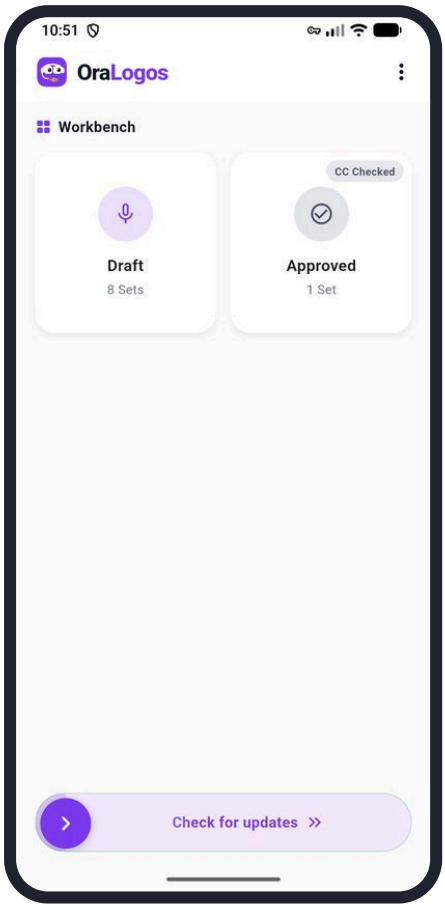

Files that did not download, each with Try again and Skip.

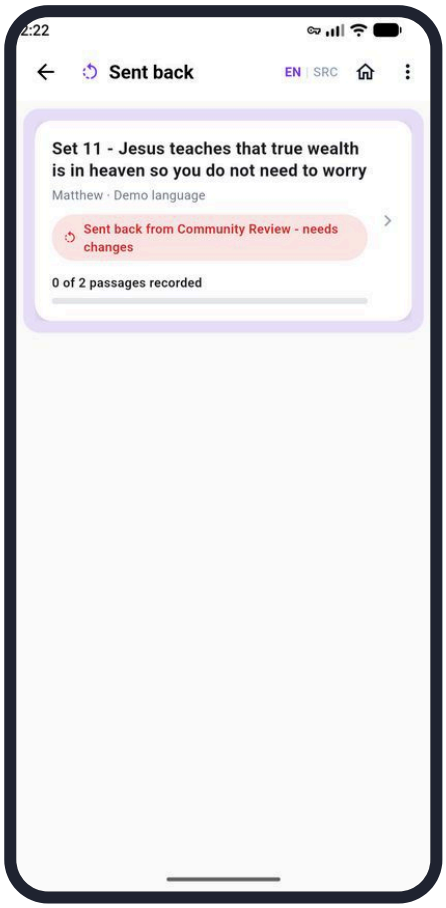

You sign in every time you open the app. With internet the server checks your password; without it the phone checks it against your last sign-in, and your work is there as you left it. The first sign-in on a phone needs internet, because that is when your work is downloaded.

4. Finding your way around

After the download you see the **Workbench**. Each tile is one list of Sets waiting for you and shows how many are there. The tile with the soft pulsing glow is where the app suggests you go next. Tap a tile to see its Sets.

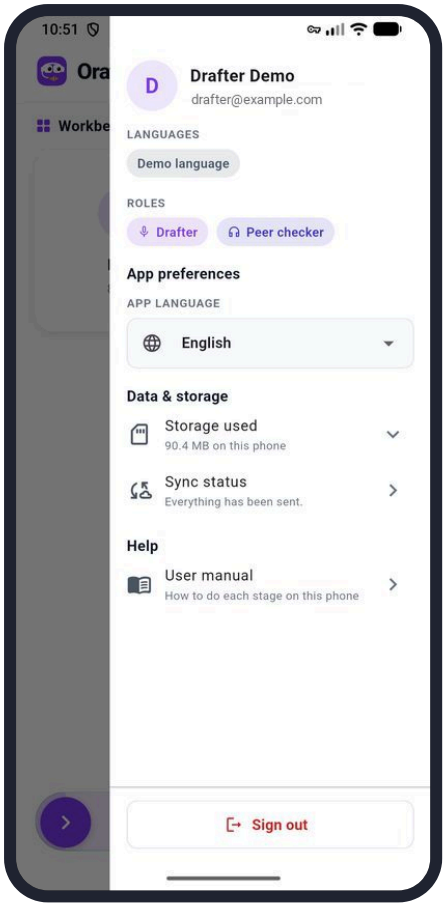

A Drafter's Workbench. Nothing waits to be sent, so the bar says Check for updates.

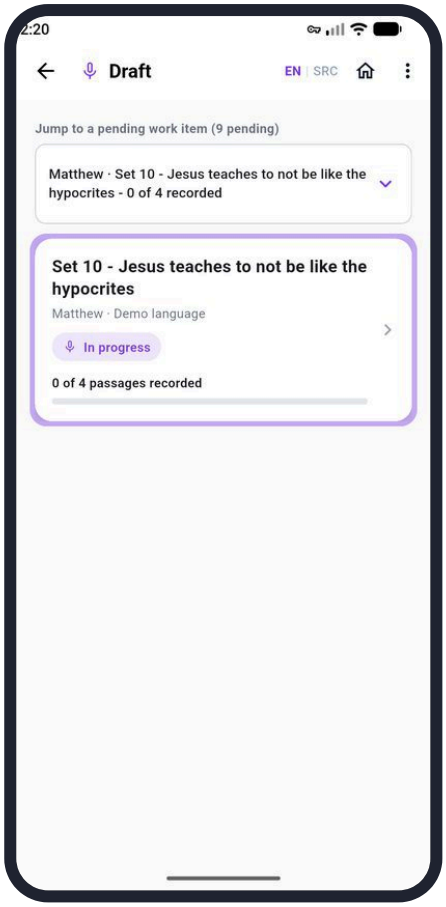

The Sent back tile opened: the Set says which stage returned it.

The bar at the top

Item	What it does
← Back arrow	Goes back one screen. The phone's own back gesture does the same.
Home icon	Goes straight back to the Workbench.
EN | SRC	Shows the names of books and Sets in English or in the source language.
⋮ three dots	Opens **Settings**: your languages and roles, the app language (English, Hindi or Urdu), storage used, Sync status, the User manual, and Sign out.

Settings, behind the three dots.

The Draft tile: a Set card with its progress bar.

Choosing a Set

Inside a tile, the Sets waiting for you are shown as cards with their progress. The box at the top, **Jump to a pending work item**, lists every Set you still have to do; pick one to go straight to it.

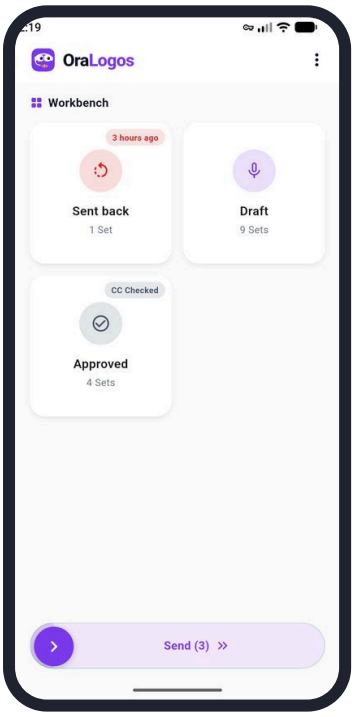

5. Sending your work and getting new work

OraLogos keeps your work on the phone until you send it. Nothing leaves the phone on its own, so you can keep working where there is no internet.

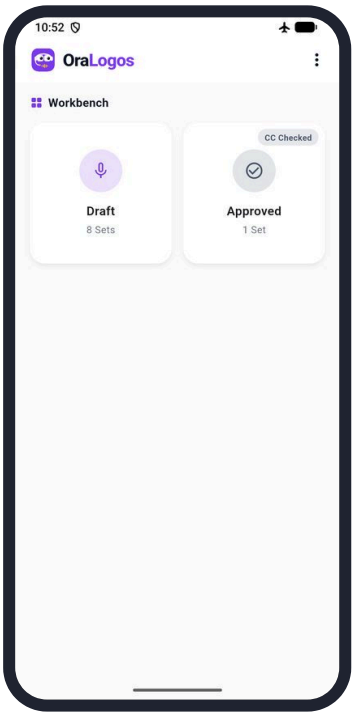

The **bar at the bottom of the Workbench** does the sending. It only appears while the phone has internet; without it you see a grey line such as *No network. 3 changes are waiting to be sent.*

- **Send (3)** — three Sets have changes on this phone: new takes, final choices, comments, questions, answers, verdicts, back translations or stage moves. **Slide the purple knob to the right** (do not just tap). Keep the screen open until it finishes.
- **Check for updates** — shown when nothing is waiting. Sliding it fetches new work: Sets assigned to you, Sets sent back to you, and files skipped earlier. Sets that are no longer yours are removed from the phone with their audio.

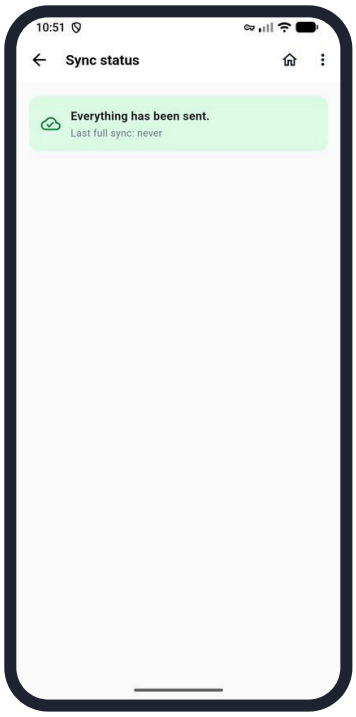

Each send also carries the time you worked and a record of what you did (for example “take recorded”), for your administrator’s reports.

Three Sets waiting: slide Send.

No internet: the bar is gone until the phone is connected.

Sync status when everything has been sent.

> When you move a Set to the next stage, it leaves your list at once — but the next person only receives it after you slide **Send**.

Sync status

Open ⋮ → **Sync status** to see what is still waiting and when the last full send was. If the server refused a Set, it is listed with the reason in red, and your work on it stays on the phone. Two buttons can appear: `Save recordings` keeps a copy of that Set’s recordings in the phone’s Download folder, and `Give up this work` discards the refused work (only when the server cannot ever accept it).

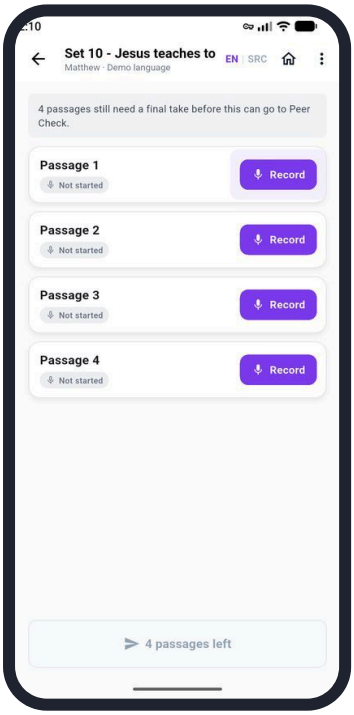

6. The Drafter: recording a Set

Open **Draft** and tap a Set. You see its passages. Each one shows whether it is **Not started**, has takes, or is **Finalized**. The grey note at the top says how many still need a final take.

Recording a passage

Tap Record on a passage. The passage screen has the **source audio**, the **source script** and the **target script** at the top, the take strip below, and the record button at the bottom. The microphone stays grey until you have listened and read:

1. **Listen** to the source audio all the way to the end. Tap the waveform to jump to a spot; **1x** changes the speed.
2. **Read** the source script and the target script, and tick **I have read** under each one. The arrows in the corners open a script full screen.
3. Tap the purple **microphone** and speak the passage. A red clock counts the seconds. The orange button **pauses**; the red button **stops** and saves the take.
4. The app checks the take at once (**Automated QC**): clipping, silence at the ends, noise, length against the source, whether a voice was found, even volume. Green ticks pass, red crosses tell you what to fix. The take gets **QC: Good** or **QC: Bad**.
5. You can record up to **6 takes** per passage. The squares in the strip show which are recorded.

A new Set with four passages.

Before listening: the microphone is grey.

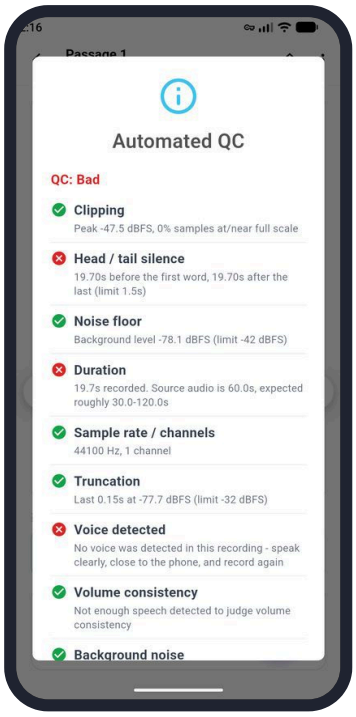

Both scripts ticked: ready to record.

> The phone remembers that you heard the source and read the scripts for this round of the Set. Coming back tomorrow to record take three, you go straight to the microphone.

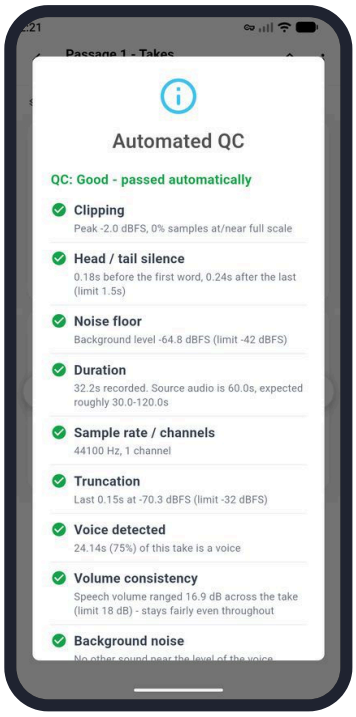

6. The Drafter: recording a Set (continued)

Recording: pause (orange) and stop (red).

A bad take: the QC says what went wrong.

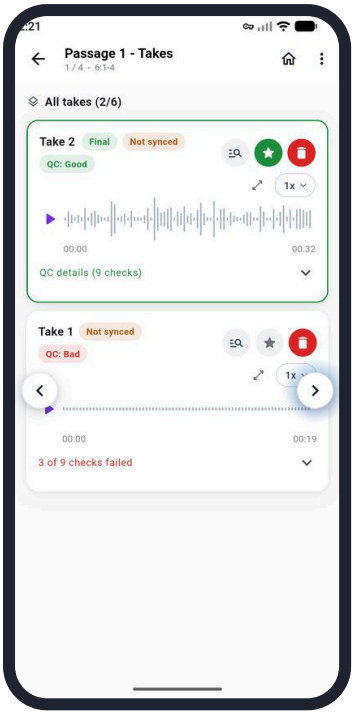

A good take.

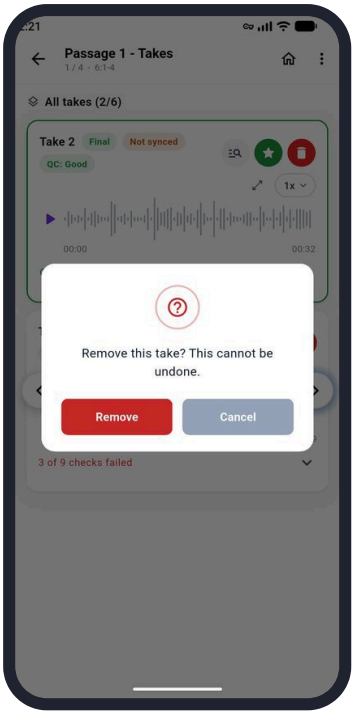

Choosing the final take

Tap any square in the take strip to open the **Takes** page. Every take has its own player, a magnifier (runs the QC again and shows the checks), a **star** and a red **bin**.

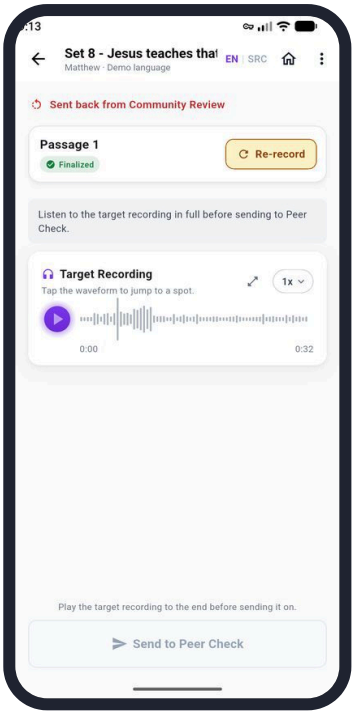

- Play each take and tap the **star** on the best one: it turns green and the take is marked **Final**. Only a take graded **Good** can be made Final; on a Bad take the star stays grey and the reason is written on the card. Tap the star again to un-mark it.
- The bin deletes a take. It asks first; a deleted take cannot be brought back.
- **Not synced** on a take means it is still only on this phone.
- Use the round › arrow at the edge of the screen to move to the next passage, or the back arrow to the Set page.

The Takes page: take 2 is Final.

Deleting a take asks first.

All passages final: hear the Target Recording, then send.

Sending the Set to Peer Check

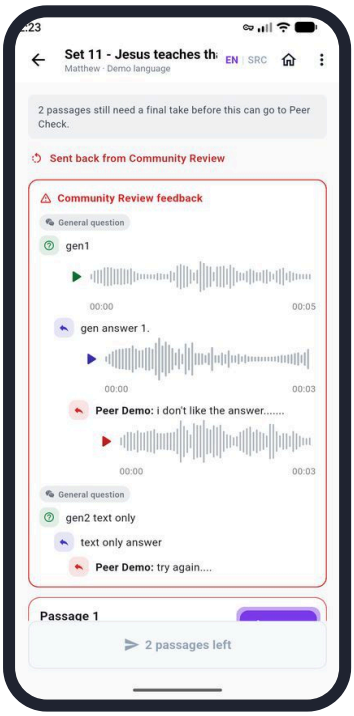

When every passage is Finalized, the Set page shows the **Target Recording**: all the final takes joined together. Play it to the end. The Send to Peer Check button then turns on. Tap it and confirm with **Send**. Then slide **Send** on the Workbench when you have internet.

Sets the Consultant has approved appear under **Approved**. Open one and tap Listen to fetch its finished recording and hear it in the app.

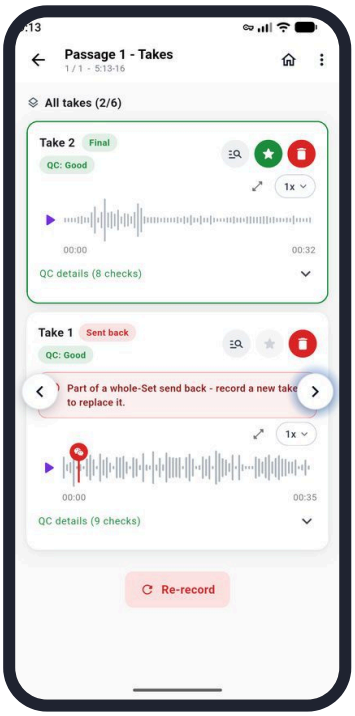

7. The Drafter: a Set that was sent back

A Set that a reviewer sent back appears on the red **Sent back** tile, with a badge saying how long ago. At the top of the Set it says who sent it back, and the reviewer's comments are shown in a red box: from Community Review you see the question, the community's answer and the reviewer's reply, with a play button for each voice message. Passages that need a new take are outlined in red.

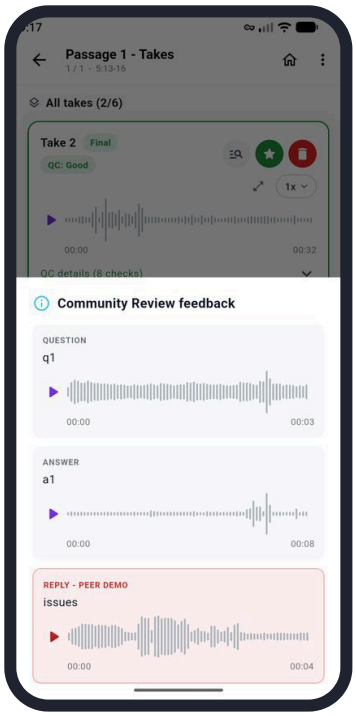

1. Tap Re-record on a red passage. On the Takes page the old final take is marked **Sent back** with the reason, and a red **pin** on its waveform marks the exact spot of the comment. Tap the pin to read or hear the whole comment.
2. Record a new take and make it Final. The old take stays for comparison until you delete it.
3. When every passage has a Final take again, play the Target Recording to the end and send the Set on. The button says where it goes: back to **Peer Check**, or straight to **the Back Translator** when it was the Back Translator who returned it.
4. Slide **Send** on the Workbench.

The red feedback box and the outlined passage.

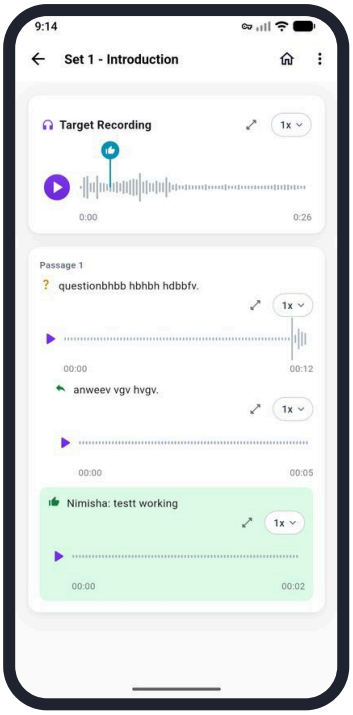

The returned take with its pin.

The full comment, from the pin.

Feedback

When a Community Reviewer **liked** an answer and added a comment for you, the **Feedback** tile shows it. Open the Set: a thumbs-up marker on the Target Recording shows where the praised answer belongs, and the question, answer and the reviewer's comment are listed under it. Nothing needs to be done with it — it is the only good news that travels back down the line.

A Set under Feedback: the liked answer and the reviewer's comment.

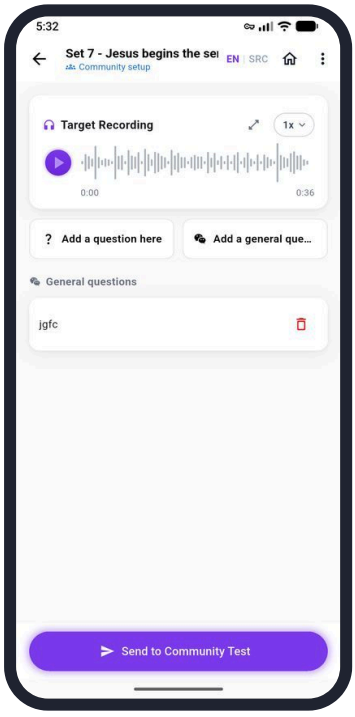

8. The Drafter: Community Setup and Community Test

Community Setup: writing the questions

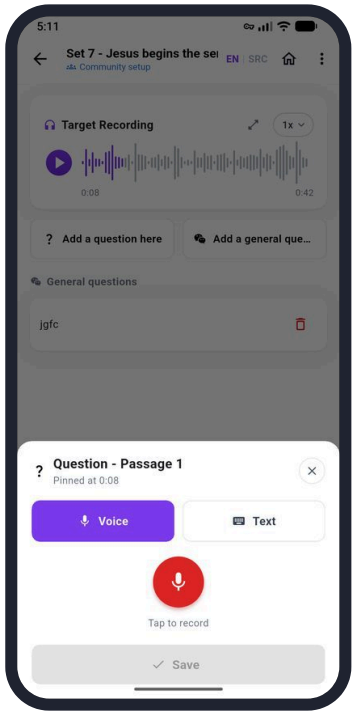

After Peer Check the Set comes back to you under **Community Setup**. Here you prepare the questions you will ask the community.

- Play the **Target Recording** and stop where a question belongs, then tap `Add a question here`. The question is **pinned** at that spot (the sheet says *Pinned at 0:08*). Choose **Voice** and tap the red microphone to record it, or **Text** and type it, then **Save**.
- `Add a general question` asks about the whole Set. General questions are listed under the player; the red bin removes one.
- Tap `Send to Community Test`, confirm, then slide **Send** on the Workbench.

> If the Set comes back after Community Review sent it back, Community Setup starts empty. The previous questions were about the old recording, so you write new ones.

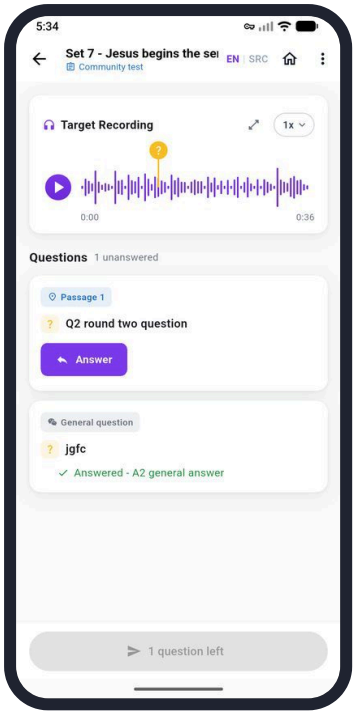

Community Setup with a general question.

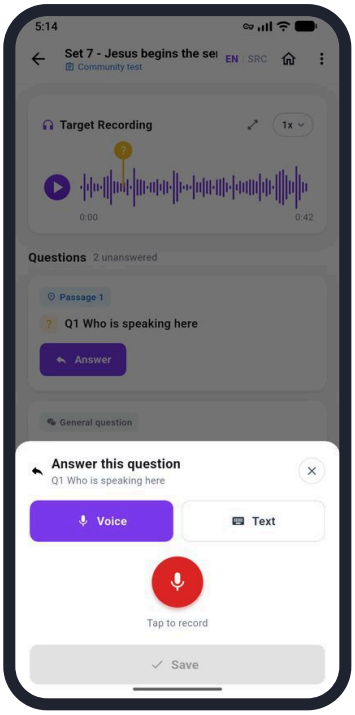

The question sheet: Voice or Text.

Community Test: asking the community

1. Sit with the community and play the whole recording. The questions appear only after it has been heard to the end.
2. Tap `Answer` under each question. Record the community's answer with **Voice** or type it with **Text**, then **Save**.
3. When every question is answered the bottom button becomes `Send to Community Review`. Tap it, confirm, then slide **Send** when you have internet again.

Community Test: one answered, one to go.

The answer sheet.

9. The Peer Checker: Peer Check and Community Review

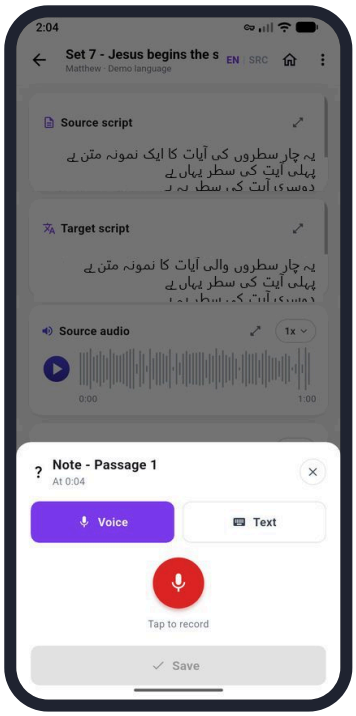

Peer Check

Open a Set under **Peer Check**. The page shows the **Source script**, the **Target script**, the **Source audio** and the Drafter's **Target Recording**. The scripts follow the passage that is playing.

1. Play **both** recordings to the end.
2. If something needs to change, stop at that spot and tap `Add a note here`. Say it with **Voice** or type it, then **Save**. A pin appears on the waveform; tap it to review or delete the note.
3. Then choose: `Send back to the Drafter` if you left notes, or `Send to Community Setup` if the recording is good. Open notes block the forward button — delete them, or send the Set back. Confirm, then slide **Send**.

Peer Check: both recordings and both scripts.

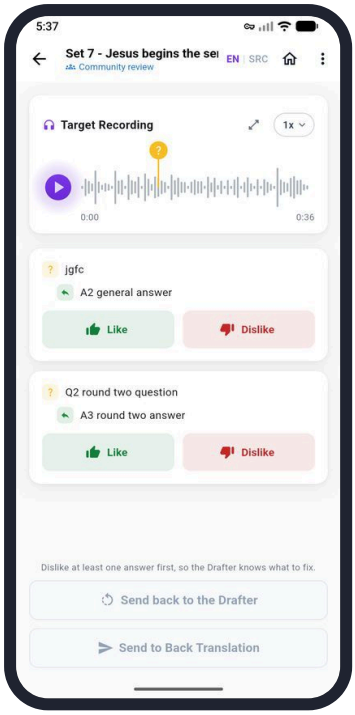

The note sheet, pinned at the spot you stopped.

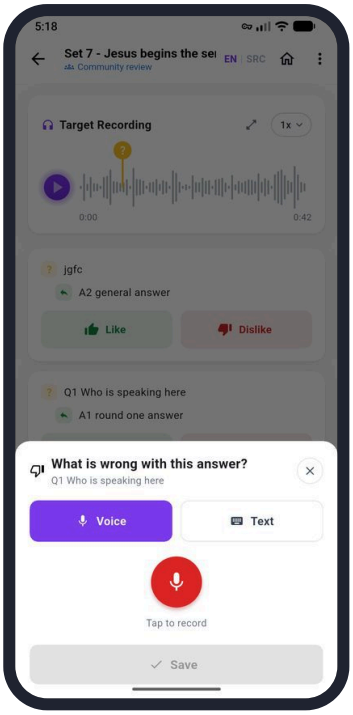

Community Review

After the Community Test the Set comes to you under **Community Review**. Each card shows a question and the community's answer; voice ones have a play button.

- Tap `Like` when an answer shows the community understood. You may add a comment for the Drafter; it reaches them under **Feedback**.
- Tap `Dislike` when they did not, and say what is wrong. The Drafter works from your comment.
- Liked every answer? Tap `Send to Back Translation`. Disliked any? Tap `Send back to the Drafter`. A question with no answer blocks both; the grey line above the buttons tells you.

Community Review: Like or Dislike each answer.

Dislike asks what is wrong.

10. The Back Translator

Only the target audio is downloaded for this role — no source audio and no questions — so signing in is quick. Open a Set under **Back Translation**. The page shows the **Target Recording** at the top and a **Back translation** card under it (*text or voice — either is fine*).

1. Play the **Target Recording** to the end. The submit button stays off until the whole recording has been heard.
2. Type the back translation into the box, or tap `Tap to record audio` and speak it. You may do both. It is saved on the phone as you go.
3. If the Consultant sent the Set back, the card **The Consultant sent this back** lists their comments. Play each one and tap `Reply` to answer it (voice or text). Submitting a new back translation closes those comments.
4. Tap `Submit to Consultant`, confirm with **Submit**, then slide **Send** on the Workbench.

If the **recording itself** has a problem, stop at that spot and tap `Not satisfied? Comment on it` under the player, then `Send back to the Drafter`. The Drafter fixes the passage and the Set comes straight back to you. An open comment of your own blocks Submit: send the Set back or delete the comment first.

> Audio never plays while you record. Starting a recording pauses anything that is playing.

11. The Consultant

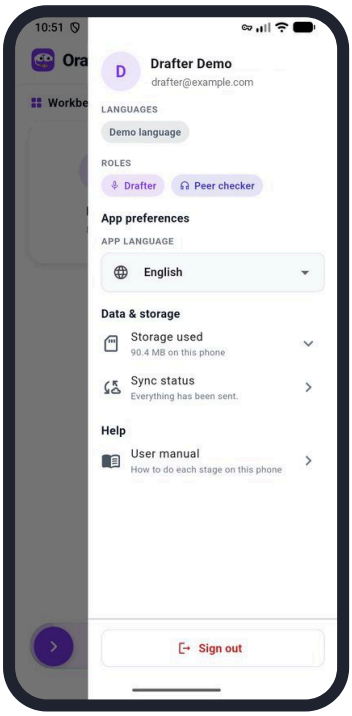

Open a Set under **Consultant Check**. From the top: the **Source script**, the **Source audio**, the **Target script**, the **Target Recording**, and the **Back translation** with its text and recording. Under it are **Your comments** and the Back Translator's replies.

1. Play the back translation recording to the end (Approve waits until it has been heard). Compare it with the source.
2. If something needs to change, tap `Comment on the back translation`. Voice or text, then **Save**. Add as many as you need; the bin deletes your own.
3. Then choose:
   - `Approve` when all is well. Open comments block Approve, so delete them first. The Set moves to **Approved**.
   - `Send back to the Back Translator` when you left comments. Confirm with **Send back**. The Back Translator replies to each comment; when the Set returns you see the earlier round in grey with their replies under it.
4. Slide **Send** on the Workbench.

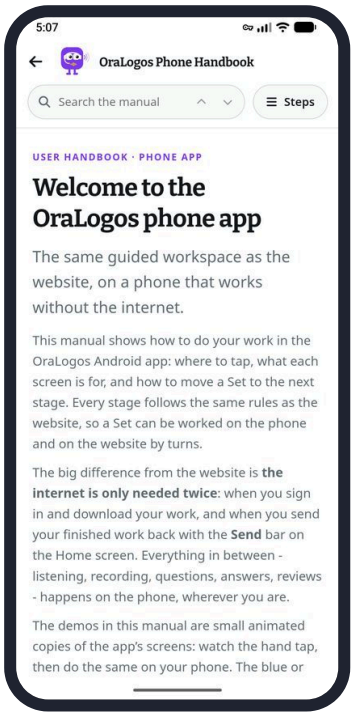

12. The built-in handbook

The app carries its own handbook, with short animated demos of every screen: watch the hand tap, then do the same on your phone. It works without internet.

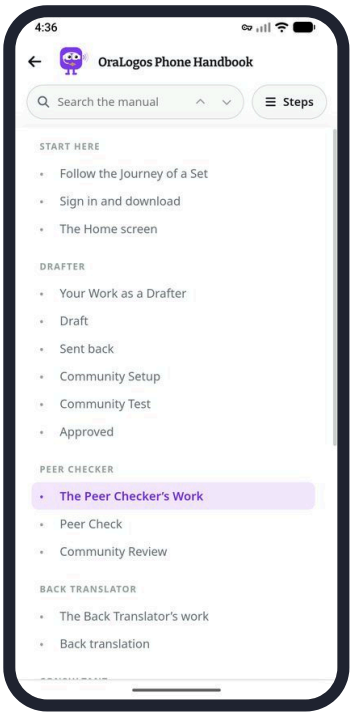

1. Tap the ⋮ three dots on any screen.
2. Under **Help**, tap **User manual**.
3. Use the **Steps** button to jump to a stage, or the search box to find a word. The ← arrow in the handbook's own bar brings you back to the app.

Settings: User manual under Help.

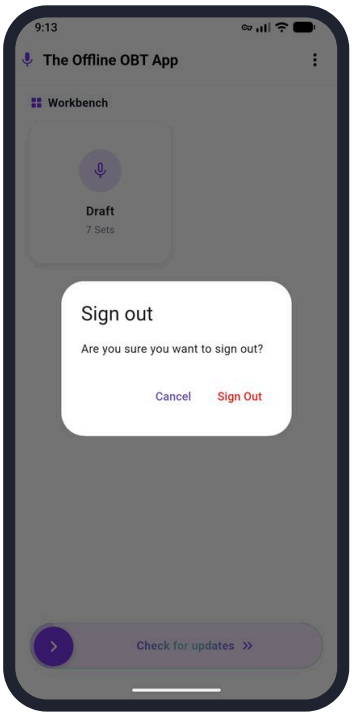

The handbook inside the app.

The Steps menu.

13. Keeping your work safe

- **Files stay inside the app.** Everything the app keeps on the phone (audio, scripts, your takes) is in its private storage, where other apps and the Files app cannot see it, and it is encrypted whenever you are signed out. Your sign-in is kept in the phone's secure keystore.
- **Nothing is kept longer than needed.** After a Check for updates the app removes Sets that are no longer yours, with their audio. Approved Sets keep only their list entry; the audio comes down again when you tap Listen.
- **No exports.** The app does not save recordings or scripts to Download or anywhere else, because the content is sensitive. The one exception is **Save recordings** on Sync status, for work the server refused.
- **Signing out keeps your work.** The sign-out box only asks whether you are sure. Your Sets, recordings and unsent work stay on the phone, locked, until you sign in again. The app also signs you out by itself after 15 minutes without a touch.
- **Do not share your sign-in.** Everything you do is recorded against your name.

The sign-out box. Cancel keeps you signed in.

> OraLogos also records the time you spend on each stage and what you did (for example "take recorded" or "sent to Peer Check"). This goes to your administrator's reports with each send. Time only counts while a stage screen is open and you are touching the phone.

14. Updating and uninstalling

Installing a new version

1. Slide **Send** so nothing is waiting to be sent.
2. Download the new **OraLogos-x.y.z.apk** from the OraLogos website and open it from the Files app, exactly as in section 2. Android asks **“Do you want to update this app?”**; tap **Update** (or **Install**). You stay signed in and your work is kept.

> Never uninstall the old version first to update — uninstalling deletes everything the app holds, including unsent work.

Uninstalling

1. Slide **Send**, then sign out (⋮ → **Sign out**).
2. Touch and hold the OraLogos icon and choose **Uninstall**, or open **Settings** → **Apps** → **OraLogos** → **Uninstall**.

15. Problems and what to do

What you see	What to do
“Not allowed to install unknown apps” when opening the APK	Tap **Settings** on that box and switch on **Allow from this source** for the Files app (section 2).
Play Protect: “App scan recommended” or “Blocked”	Tap **Scan app**, then **Install**. On older phones: **More details** → **Install anyway** (section 2).
“App not installed”	The phone is out of space, or the file was cut short while it was being sent. Free some space and download the APK again.
Sign-in fails	Check the internet connection, and the email and password (use the eye icon). If it still fails, ask your administrator to check your account.
Some files did not download	Choose **Try again** or **Skip** in the list. Skipped files come with the next **Check for updates**.
The microphone button is grey	Read the text beside it: play the source to the end, tick **I have read** under both scripts, or all six takes are used — delete one.
“Microphone is off”	Tap **Open settings** and allow the microphone for OraLogos (section 2). Then record again.
A take is graded **Bad**	Open the QC. Record in a quiet room, hold the phone close, speak clearly and the whole passage. A silent or very short take never passes.
A Send button is grey	Play the recording to the end first. Also check that every passage is Finalized, every question is answered, and no comment is still open. The grey line above the button says what is missing.
The Send bar is missing on the Workbench	The phone has no internet. Connect, and the bar comes back.
A Set would not send	Open ⋮ → **Sync status** for the reason. Usually the Set was changed on the website meanwhile: slide **Check for updates**, then **Send** again. Your work stays on the phone until it goes.
I cannot see a Set I expect	Slide **Check for updates**. If it is still missing, the previous person may not have sent it yet.
The app was closed while recording	Open the passage again: the recording made so far is recovered and saved as a take.
The waveform does not appear at once	Long recordings take a moment to draw the first time. Playing works meanwhile.

For anything else, contact your project administrator, or open the built-in handbook (⋮ → **User manual**).
